

CLAIMS

What is claimed is:

1. A roll dispenser comprising:
a single piece having:
a first panel,
a front panel having first and second substantially parallel edges and attached along said first edge to said first panel, and
a second panel attached to said front panel along said second edge of said front panel,
said first panel having a protruding pin generally proximate the center of said front panel,
said second panel having a protruding pin generally proximate the center of said second panel,
wherein the distal end of said protruding pin of said first panel and the distal end of said protruding pin of said second panel fixedly engage providing support for the roll.
2. The roll dispenser of claim 1 further comprising:
said first panel having a hook along one edge of said first panel generally distal the edge of said first panel attached to said front panel,
said second panel having a hook along one edge of said second panel generally distal the edge of said second panel attached to said front panel,
wherein each said hooks are adapted to suspend said dispenser.
3. The roll dispenser of claim 2 further comprising:
said first panel having an open region below said hook of said first panel,
said second panel having an open region below said hook of said second panel,

wherein each of said regions are adapted to engage a support offering lateral resistance to the dispenser prohibiting rotation of the dispenser about said hooks.

4. A roll dispenser comprising:

a single piece having:

a first panel,

a front panel having first and second substantially parallel edges and attached long said first edge to said first panel, and

a second panel attached to said front panel along said second edge of said front panel,

said first panel having a protruding pin generally proximate the center of said front panel and having a hook along one edge of said front panel generally distal the edge of said first panel attached to said front panel,

said second panel having a protruding pin generally proximate the center of said second panel, and having a hook along one edge of said second panel generally distal the edge of said second panel attached to said front panel,

wherein the distal end of said protruding pin of said first panel and the distal end of said protruding pin of said second panel fixedly engaged providing support for the roll and wherein each said hooks are adapted to suspense said dispenser.

5. A roll dispenser comprising:

A single injection molded piece having:

a first panel,

a front panel having first and second substantially parallel scored edges and having said first said edge integrally molded to said first panel, and

A second panel integrally molded to said front panel along said second scored edge of said front panel, said first panel having an integrally molded protruding pin generally proximate the center of said front panel and having a hook along one edge of said first panel generally distal the scored edge of said first panel integrally molded to said first panel, said second panel having an integrally molded protruding pin generally proximate the center of said second panel and having a hook along one edge of said second panel generally distal the scored edge of said second panel integrally molded to said front panel, wherein the distal end of said protruding pin of said first panel and the distal end of the protruding pin of the said second panel are adapted to fixedly engaged around a roll to provide support for the roll, and wherein each said hooks are adapted to suspend said dispenser.
